Because of this high degree of consumer respect and confidence, Aseries Canons have consistently been U.S. and international sales leaders. While the A2000 IS retains many the best features of its predecessors, it is a revolutionary departure from the basic design philosophy that has driven and defined earlier Aseries digicams. For those unfamiliar with Canon's Aseries digicams the most obvious differences between the two cameras include size the A2000 IS is noticeably smaller and thinner than the A720 IS and the lack of an optical viewfinder the A720 IS had one, but the new model does not. That said, the A2000's DIGIC III processor does a great job providing enhanced

performance including quicker startup, faster AF, more efficient processing, and faster shutter fire times than most of its competitors. The A2000 IS's menu system accessed via a dedicated button beneath the compass switch is logical, easy to navigate, and brutally simple since the camera permits only minimal user input. The A2000 IS is attractive and fairly compact, but also noticeably different thinner, about 25 percent smaller, and 15 grams lighter than its predecessors. Operation is basic all exposure options are minor variations on the auto mode theme. Most purchasers will have no difficulty using the camera right out of the box. In my previous digital camera reviews I've consistently thumped digicams that eschew optical viewfinders, but after using the A2000 IS for the past six weeks I've changed my mind, if only a tiny bit. For portraits and urban shooting, I'd still prefer a traditional optical viewfinder, but in most other situations the A2000's screen is an acceptable substitute. Resolution is 230,000 dots, noticeably better than the A720's 115,000 dot LCD. The user-enabled LCD gridline display is a nice and useful touch as well. AF speed is dependably quick in all but the most difficult lighting. Shottoshot times in single shot mode are about average at between 3.0 and 3.5 seconds.

In all exposure modes the camera analyzes the scene in front of the lens and then calculates camera to subject distance to determine which of the 9 AF points is closest to the primary subject closest subject priority and then locks focus on that AF point. Users can also opt for the 1 AF point center AF for classic portraits or traditional landscapes. When the camera is powered up the zoom extends automatically and when the camera is powered down the zoom is fully retracted into the camera body and a builtin iris style lens cover closes to protect the front element. Canon claims the maximum flash range is about 11 feet and that appears to be a fairly accurate claim based on my very limited flash use. IS allows users to shoot at shutter speeds up to three fstops slower than would have been possible without IS. Image stabilization can also be a very useful when shooting dimly lit indoor venues where flash is inappropriate. A2000 IS users should keep in mind that leaving the camera in the continuous IS mode fulltime noticeably reduces battery life. Motion Detection works in concert with the A2000's OIS system and auto focus system to produce acceptable images under less than ideal conditions, but there really is no free lunch as sensitivity increases so does noise. Canon claims alkaline AAs are good for up to 240 exposures, and NiMH rechargeable AAs are good for up to 500 exposures. Kudos to Canon, however, for including a pair of decent Panasonic LR6AA alkaline cells in the box, as opposed to the super cheapie AAs that most manufacturers include if they give you any at all. Outdoors in good light the A2000 IS produces dependably well exposed almost noise free images with hueaccurate, slightly oversaturated colors and somewhat harder than average contrast. In bright contrasty lighting, highlight detail was occasionally blownout. Overall, though, the A2000 IS's image quality is noticeably better than the average for cameras of this type.

Exposure is automatically managed by the camera's DIGIC III processor, which combines most primary camera functions image interpolation and processing, auto exposure, white balance, JPEG processing, gain control, and power management in one chip to improve efficiency and processing speed. Barrel distortion at the wideangle end of the zoom range is minimal, which is impressive since barrel distortion is a common fault with small, highly complex digicam zooms. Pincushion distortion is essentially invisible at the telephoto end of the zoom. At the ISO 400 setting noise levels are noticeably higher and there's a perceptible loss of minor detail. I've used it to shoot the marine fish catalog for an online aquarium store, portraits formal, informal, and environmental, action skateboarders and BMX bikers, my neighbor's new litter of puppies, and several autumn events parades, festivals, and a farmers markets. The A2000 IS handled all outdoor imagemaking chores with aplomb and amazingly good results.
